

# Euclid's Elements

## Book VI

*One can state, without exaggeration, that the observation of and the search for similarities and differences are the basis of all human knowledge.*

**Alfred Nobel**

# Table of Contents, Chapter 6

1	If the height of two triangles are equal, then the ratio of the areas is equal to the ratio of the bases	7	If two triangles have one angle equal to one angle, and the sides about other angles are proportional, and the remaining angles either both less or both not less than a right angle, then triangles will be equiangular	14	In equal and equiangular parallelograms, the sides about the equal angles are reciprocally proportional; and vice versa
2	<b>If a line cuts a triangle, parallel to its base, it will cut the sides of the triangle proportionally</b>	8	If in a right-angled triangle a perpendicular be drawn from the right angle to the base, the triangles adjoining the perpendicular are similar both to the whole and to one another	15	In equal triangles which have one angle equal to one angle the sides about the equal angles are reciprocally proportional; and vice versa
3	If an angle of a triangle is bisected and the straight line cutting the angle also cuts the base, the segments of the base will have the same ratio as the remaining sides of the triangle	9	From a given straight line to cut off a given fraction	16	If four straight lines are proportional, the rectangle contained by the extremes is equal to the rectangle contained by the means, and vice versa
4	If two triangles have equal angles, then the sides opposite the equal angles are proportional, as well, the sides of the triangles on either side of the equal angles are also proportional	10	To cut a given uncut straight line similarly to a given cut straight line	17	If three straight lines are proportional, the rectangle contained by the extremes is equal to the square on the mean; and vice versa
5	If two triangles have proportional sides, the triangles will be equiangular	11	To two given straight lines to find a third proportional	18	On a given straight line to describe a rectilineal figure similar and similarly situated to a given rectilineal figure
6	If two triangles have one angle equal to one angle and the sides about the equal angles are proportional, then the triangles will be equiangular	12	To three given straight lines to find a fourth proportional	19	Similar triangles are to one another in the duplicate ratio of the corresponding sides
		13	To two given straight lines to find a mean proportional		

# Table of Contents, Chapter 3

20	Similar polygons are divided into the same number of similar triangles, which have the same ratio as the wholes, and the polygons have duplicate ratios to their corresponding sides	26	If from a parallelogram a similar parallelogram with a common angle is subtracted, it is about the same diameter as the original	31	In right-angled triangles the figure on the side subtending the right angle is equal to the similar and similarly described figures on the sides containing the right angle
21	Figures which are are similar to the same rectilineal figure are also similar to one another	27	Of all the parallelograms applied to the same straight line and deficient by parallelogrammic figures similar to a parallelogram drawn on half the said line, the largest will be one that is drawn on half of the straight line and is similar to the defect		
22	If four straight lines are proportional, similar rectilineal figures will also be proportional; and vice versa	28	To a given straight line, apply a parallelogram equal to a given rectilineal figure and deficient by a parallelogrammic figure similar to a given one		
23	Equiangular parallelograms have to one another the ratio compounded of the ratios of their sides	29	To a given straight line, apply a parallelogram equal to a given rectilineal figure and exceeding by a parallelogrammic figure similar to a given one		
24	In any parallelogram the parallelograms about the diameter are similar both to the whole and to one another	30	To cut a finite straight line in extreme ratio		
25	To construct one and the same figure similar to a given rectilineal figure and equal to another given rectilineal figure				

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

if  $DE \parallel BC \rightarrow BD:DA=CE:EA$   
if  $BD:DA=CE:EA \rightarrow DE \parallel BC$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

BC || DE

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

BC || DE

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I.38)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$BC \parallel DE$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I.38)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$BC \parallel DE$

$$\triangle BDE = \triangle CDE$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I.38)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$BC \parallel DE$

$$\triangle BDE = \triangle CDE$$

$$\triangle BDE : \triangle ADE = \triangle CDE : \triangle ADE$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I·38)

Since BDE and CDE are equal, they have the same ratio to the triangle ADE (V·7)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$BC \parallel DE$

$\triangle BDE = \triangle CDE$

$\triangle BDE : \triangle ADE = \triangle CDE : \triangle ADE$

$BD : DA = \triangle BDE : \triangle ADE$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I·38)

Since BDE and CDE are equal, they have the same ratio to the triangle ADE (V·7)

The ratio of the triangles BDE to ADE is equal to the ratio of the bases BD and DA (VI·1)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$BC \parallel DE$

$$\triangle BDE = \triangle CDE$$

$$\triangle BDE : \triangle ADE = \triangle CDE : \triangle ADE$$

$$BD : DA = \triangle BDE : \triangle ADE$$

$$CE : EA = \triangle CDE : \triangle ADE$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I·38)

Since BDE and CDE are equal, they have the same ratio to the triangle ADE (V·7)

The ratio of the triangles BDE to ADE is equal to the ratio of the bases BD and DA (VI·1)

Similarly, the ratio of the triangles CDE to ADE is equal to the ratio of the bases CE and EA (VI·1)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$BC \parallel DE$

$\triangle BDE = \triangle CDE$

$\triangle BDE : \triangle ADE = \triangle CDE : \triangle ADE$

$BD : DA = \triangle BDE : \triangle ADE$

$CE : EA = \triangle CDE : \triangle ADE$

$BD : DA = \triangle BDE : \triangle ADE = \triangle CDE : \triangle ADE = CE : EA$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I·38)

Since BDE and CDE are equal, they have the same ratio to the triangle ADE (V·7)

The ratio of the triangles BDE to ADE is equal to the ratio of the bases BD and DA (VI·1)

Similarly, the ratio of the triangles CDE to ADE is equal to the ratio of the bases CE and EA (VI·1)

Since equality of ratios are transitive, BD to DA is equal to CE to EA

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$BC \parallel DE$

$$\triangle BDE = \triangle CDE$$

$$\triangle BDE : \triangle ADE = \triangle CDE : \triangle ADE$$

$$BD : DA = \triangle BDE : \triangle ADE$$

$$CE : EA = \triangle CDE : \triangle ADE$$

$$BD : DA = \triangle BDE : \triangle ADE = \triangle CDE : \triangle ADE = CE : EA$$

$$BD : DA = CE : EA$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 1)

Draw the lines BE and CD

The triangles BDE and CDE are equal, because they have the same base DE, and the same parallels DE and BC (i.e. are the same height) (I·38)

Since BDE and CDE are equal, they have the same ratio to the triangle ADE (V·7)

The ratio of the triangles BDE to ADE is equal to the ratio of the bases BD and DA (VI·1)

Similarly, the ratio of the triangles CDE to ADE is equal to the ratio of the bases CE and EA (VI·1)

Since equality of ratios are transitive, BD to DA is equal to CE to EA

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$$BD:DA = CE:EA$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 2)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$$BD : DA = CE : EA$$

$$BD : DA = \triangle BDE : \triangle ADE$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 2)

The ratio of the bases BD and DA is equal to the ratio of the triangles BDE to ADE (VI.1)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$$BD : DA = CE : EA$$

$$BD : DA = \triangle BDE : \triangle ADE$$

$$CE : EA = \triangle CDE : \triangle ADE$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 2)

The ratio of the bases BD and DA is equal to the ratio of the triangles BDE to ADE (VI.1)

Similarly, the ratio of the bases CE and EA is equal to the ratio of the triangles CDE to ADE (VI.1)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$$BD:DA = CE:EA$$

$$BD:DA = \triangle BDE:\triangle ADE$$

$$CE:EA = \triangle CDE:\triangle ADE$$

$$\triangle BDE = \triangle CDE$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 2)

The ratio of the bases BD and DA is equal to the ratio of the triangles BDE to ADE (VI·1)

Similarly, the ratio of the bases CE and EA is equal to the ratio of the triangles CDE to ADE (VI·1)

Since each of the triangles BDE and CDE have the same ratio to ADE, they are equal (V·9)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$$BD:DA = CE:EA$$

$$BD:DA = \triangle BDE:\triangle ADE$$

$$CE:EA = \triangle CDE:\triangle ADE$$

$$\triangle BDE = \triangle CDE$$

$$DE \parallel BC$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversely, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 2)

The ratio of the bases BD and DA is equal to the ratio of the triangles BDE to ADE (VI·1)

Similarly, the ratio of the bases CE and EA is equal to the ratio of the triangles CDE to ADE (VI·1)

Since each of the triangles BDE and CDE have the same ratio to ADE, they are equal (V·9)

BDE and CDE are equal, and they are on the same base, therefore they are on the same parallels (I·39)

## Proposition 2 of Book VI

If a straight line be drawn parallel to one of the sides of a triangle, it will cut the sides of the triangle proportionally; and, if the sides of the triangle be cut proportionally, the line joining the points of section will be parallel to the remaining side of the triangle.

$$BD:DA = CE:EA$$

$$BD:DA = \triangle BDE:\triangle ADE$$

$$CE:EA = \triangle CDE:\triangle ADE$$

$$\triangle BDE = \triangle CDE$$

$$DE \parallel BC$$

### In other words

If DE is parallel to BC, then the ratio of BD to DA is equal to the ratio of CE to EA

Conversly, if the ratio of BD to DA is equal to the ratio of CE to EA, then DE is parallel to BC

### Proof (part 2)

The ratio of the bases BD and DA is equal to the ratio of the triangles BDE to ADE (VI·1)

Similarly, the ratio of the bases CE and EA is equal to the ratio of the triangles CDE to ADE (VI·1)

Since each of the triangles BDE and CDE have the same ratio to ADE, they are equal (V·9)

BDE and CDE are equal, and they are on the same base, therefore they are on the same parallels (I·39)
